

BUILT ON CLAUDE, CONNECTED TO SALESFORCE

Stop building reports. Start asking questions.

An open-source AI layer that gives Sales, PreSales, Marketing, and Customer Success real answers from live Salesforce data — in one conversation.

THE PROBLEM

Four teams, four dashboards, one customer

A Sales rep checks pipeline in one report. PreSales pulls deal detail from another tab. Marketing builds a campaign ROI dashboard. Customer Success cross-references renewal and case reports by hand every Monday morning. All four are describing the same underlying Salesforce org — just through different, disconnected views of it.

Every one of those views takes a login, a click path, and a mental switch away from the actual conversation someone's trying to have — with a customer, a manager, or a teammate.

4

functions this serves — Sales, PreSales, Marketing, CS

23

ready-made tools across those functions

1

conversation to get any of them an answer

This project asks a simple question: what if the CRM answered you directly, in plain language, inside the conversation you're already having — instead of the other way around?

One MCP server, two ways to run it

Built on Anthropic's **Model Context Protocol** — an open standard for connecting an AI assistant to real, live data. Claude doesn't get a snapshot or a training-time guess about your Salesforce org; it calls the same REST API your browser does, with your own OAuth session, in real time.

Local variant — runs on one person's laptop via Claude Desktop, session lives in a local file. Nothing to host.

Remote variant — one container, deployed to AWS, Google Cloud, or Azure, shared by a team as an always-on Custom Connector.

Real conversations, not a feature list

Sales

- Summarize open pipeline by stage, with deal count and total amount per stage
- Rank the biggest open deals by amount, with owner and close date
- See what's likely to close in a given window — a rolling forecast, not a static report
- Triage new leads by source and status
- Log a call note straight back to Salesforce as a Task, from inside the conversation

"Summarize my pipeline by stage, then show me the 10 biggest open deals."

"What's likely to close this month?"

PreSales

- Pull full deal context before a call — stage, next steps, and who's actually involved on the customer side
- See exactly what's quoted, product by product, so the demo matches the deal
- Get the entire account picture in one shot — open deals, cases, contacts, recent activity — before a QBR

"Give me everything on the Acme deal before tomorrow's call."

"What's actually being quoted on this opportunity?"

The same server, two more functions

Marketing

- Campaign ROI — cost per lead, cost per opportunity, and an ROI multiple, computed automatically
- Who actually showed up to a campaign, and their member status
- Which lead source is converting best right now, not last quarter

"Which campaigns this quarter had the best ROI?"

"Which lead source is converting best?"

Customer Success

- Open cases by priority, the first thing to check every morning
- What's renewing in the next 60 days, or whatever window matters
- At risk accounts — low probability renewals cross referenced with open high priority cases, ranked by deal size

"Which accounts are at risk in the next 60 days?"

"Give me a fast health check on this account before I call them."

Every tool is documented for what it's built on — standard Salesforce fields where possible, with a clear note on where an org's custom fields (health score, NPS, renewal risk) need one small addition. The project ships with a contributor's guide for exactly that.

Engineered to be extended, not just used

- **OAuth 2.0 Authorization Code + PKCE** for Sales/Service Cloud — a real browser login, a refresh token, no hardcoded credentials anywhere in source.
- **A separate, correctly-scoped connection for Marketing Cloud** — it's a genuinely different Salesforce product with its own API, and the code treats it that way instead of pretending it's the same system.
- **One tool file per business function** (sales, presales, marketing, customer success) sharing a single generic SOQL/REST client — adding a new tool never touches auth or another team's file.
- **Read tools and one clearly-marked mutating tool**, with the convention documented so anyone contributing keeps that split visible.
- **Two runnable entrypoints, one codebase** — a stdio process for local use, a Streamable-HTTP service with a health check and access control for cloud deployment, sharing every tool and client underneath.
- **MIT licensed**, with a contributor's guide, an environment template, and a fictional demo dataset so anyone can try the tool shapes before connecting a real org.

From a sandbox login to a live conversation

- 1 Spin up a Salesforce sandbox**
Free Developer Edition — never start against production.
- 2 Create a Connected App and authenticate once**
A browser login, a refresh token saved locally — no server-side signup.
- 3 Run it locally and try real prompts**
Confirm your org's picklist values and custom fields match before scaling up.
- 4 Move to production, containerize, deploy**
AWS App Runner, Google Cloud Run, or Azure Container Apps — same steps, your choice of cloud.
- 5 Connect it in Claude and share it out**
One Custom Connector, tested with one person first, then rolled out to the team.
