

BUILT ON CLAUDE, CONNECTED TO SALESFORCE

Stop building reports. Start asking questions.

An open-source AI layer that gives Sales, PreSales, Marketing, Support, and Customer Success real answers from live Salesforce data — in one conversation.

5

business functions unified

32

ready-made tools to start with — fork it, add your own

0

standing dashboards to build and maintain — just ask

Five teams, five dashboards, one customer

A Sales rep checks pipeline in one report. PreSales pulls deal detail from another tab. Marketing builds a campaign ROI dashboard. Support triages a case queue. Customer Success cross-references renewal and case reports by hand every Monday morning. All five are describing the same underlying Salesforce org — just through different, disconnected views of it.

Every one of those views takes a login, a click path, and a mental switch away from the actual conversation someone's trying to have — with a customer, a manager, or a teammate.

5

functions this serves — Sales, PreSales, Marketing, Support, CS

32

ready-made tools across those functions

1

conversation to get any of them an answer

This project asks a simple question: what if the CRM answered you directly, in plain language, inside the conversation you're already having — instead of the other way around?

THE SOLUTION

One MCP server, two ways to run it

Built on Anthropic's **Model Context Protocol** — an open standard for connecting an AI assistant to real, live data. Claude doesn't get a snapshot or a training-time guess about your Salesforce org; it calls the same REST API your browser does, with your own OAuth session, in real time.

Local variant — runs on one person's laptop via Claude Desktop, session lives in a local file. Nothing to host.

Remote variant — one container, deployed to AWS, Google Cloud, or Azure, shared by a team as an always-on Custom Connector.

Real conversations, not a feature list

Sales

- Summarize open pipeline by stage, with deal count and total amount per stage
- Rank the biggest open deals by amount, with owner and close date
- See what's likely to close in a given window — a rolling forecast, not a static report
- Triage new leads by source and status
- Log a call note straight back to Salesforce as a Task, from inside the conversation

"Summarize my pipeline by stage, then show me the 10 biggest open deals."

"What's likely to close this month?"

*"Log a note on the Acme deal — they want a second demo before signing." **WRITE***

PreSales

- Pull full deal context before a call — stage, next steps, and who's actually involved on the customer side
- See exactly what's quoted, product by product, so the demo matches the deal
- Get the entire account picture in one shot — open deals, cases, contacts, recent activity — before a QBR

"Give me everything on the Acme deal before tomorrow's call."

"What's actually being quoted on this opportunity?"

*"Add their new VP of Ops as a contact on this account." **WRITE***

Top of funnel, and the queue that never stops

Marketing

- Campaign ROI — cost per lead, cost per opportunity, and an ROI multiple, computed automatically
- Who actually showed up to a campaign, and their member status
- Which lead source is converting best right now, not last quarter

"Which campaigns this quarter had the best ROI?"

"Which lead source is converting best?"

Support

- Open cases by priority — the queue check, first thing every morning
- Open a new case directly from the conversation, subject and priority included
- Resolve, escalate, or annotate an existing case without switching tabs

"What's open right now by priority?"

"Open a case for the outage they just reported, mark it Critical." **WRITE**

"Mark that case resolved." **WRITE**

The relationship side, not the ticket side

Support answers "what's open right now." Customer Success answers "who's about to churn." Different job, different tools — even though both live on the same Case object underneath.

Customer Success

- Open renewals in any window you name — this quarter, next 60 days, whatever matters
- At-risk accounts — low-probability renewals cross-referenced with open high-priority cases, ranked by deal size, so you know who to call first
- A fast health check on one account — case load, last logged activity, open opportunities — before you pick up the phone

"Which accounts are at risk in the next 60 days?"

"What's renewing this quarter?"

"Give me a fast health check on this account before I call them."

Every tool is documented for what it's built on — standard Salesforce fields where possible, with a clear note on where an org's custom fields (health score, NPS, renewal risk) need one small addition. The project ships with a contributor's guide for exactly that.

One thing worth being explicit about: the function pages in this deck are organizational, not a permission boundary. A Customer Success person can call Support's `sf_create_case` or PreSales' `sf_update_contact` just as easily — every tool is available in every conversation.

TRY IT — JUST TYPE THESE

You don't need to learn a query language

Every one of these is something you can type into Claude exactly as written. Claude figures out which tool to call and how to phrase the query underneath — you just ask the question the way you'd ask a colleague.

Sales

"What's my pipeline look like by stage?"

"What's likely to close in the next 30 days?"

"Log a note on the Acme deal — they want a second demo." **WRITE**

PreSales

"Give me everything on the Acme deal before my call."

"Pull the full account picture for Acme Corp."

"Add their new VP of Ops as a contact on this account." **WRITE**

Marketing

"Which campaigns had the best ROI this quarter?"

"Who attended our last webinar, and who converted?"

"Which lead source is converting best right now?"

Support

"What's open right now by priority?"

"Open a case for the outage they just reported, mark it Critical." **WRITE**

"Mark that case resolved." **WRITE**

Customer Success

"Which accounts are at risk in the next 60 days?"

"What's renewing this quarter?"

"Give me a fast health check on this account."

The real unlock isn't one tool — it's chaining them

Claude doesn't just call one tool per question. Ask something that spans a few systems, and it works out which tools to call, in what order, and stitches the results into one answer — no separate dashboards, no manual cross-referencing.

"Before my QBR with Acme Corp, give me the full account picture, check if they're at risk, and log a follow-up task."

CHAINS `sf_get_account_360` → `sf_get_at_risk_accounts` → `sf_log_activity_note`

"Pull our top campaigns by ROI this quarter, then tell me which of those leads are still open and unworked."

CHAINS `sf_get_campaign_performance` → `sf_get_campaign_members` → `sf_get_leads`

"Summarize pipeline by stage, and log a note on any deal over \$50k with no recent activity."

CHAINS `sf_get_pipeline_summary` → `sf_get_open_opportunities` → `sf_log_activity_note`

"Check if this account is in our VIP segment in Data 360, and if their case volume is high, open a follow-up case."

CHAINS `dc_query` → `sf_get_open_cases` → `sf_create_case`

"This account just escalated — check their case history, see if they're already flagged at-risk, and bump this ticket to Critical."

CHAINS `sf_get_open_cases` → `sf_get_at_risk_accounts` → `sf_update_case`

The same chains, rendered as a visual

Every chain on the previous page returns text. Ask for a dashboard instead, and Claude fetches the same data through the same tools, then renders it as an actual chart or dashboard in the conversation — no separate BI tool, no new code on the server side.

This is the different kind of dashboard from the cover: nothing to build, nothing to maintain, nothing sitting in a tab waiting to go stale. You get one only when you ask, built from live data in that moment. Here's what two of these actually look like (fictional numbers, for illustration).

"Build me a dashboard of pipeline by stage."

CHAINS `sf_get_pipeline_summary` renders as chart

"Build a dashboard of at-risk accounts and what's renewing in the next 60 days."

CHAINS `sf_get_at_risk_accounts` `sf_get_renewals_due` renders as dashboard

Account	ARR	Risk flag
Meridian Medical Devices	\$320K	2 open critical cases
Vantage Life Sciences	\$450K	Renewal in 12 days, 40% prob
Brightpath Software	\$180K	No contact in 34 days

"Chart campaign ROI for this quarter, biggest spender to smallest."

CHAINS `sf_get_campaigns` `sf_get_campaign_performance` renders as chart

"Give me a dashboard of open cases by priority — I want to see it, not read a list."

CHAINS `sf_get_open_cases` renders as chart

"Everything I need for Monday standup — pipeline, at-risk accounts, and open cases, one dashboard."

CHAINS `sf_get_pipeline_summary` `sf_get_at_risk_accounts` `sf_get_open_cases` renders as dashboard

32 to start with — not a ceiling

This is the actual list, not a sample. 9 write data back (tagged **WRITE**); the rest only read. It's open source and built specifically so a new tool is a short, isolated addition — see the closing note below.

WRITE**WRITE****WRITE****WRITE****WRITE****WRITE****WRITE****WRITE****WRITE**

Every tool file is scoped to one business function and shares one client layer — adding a 33rd tool (yours) never touches auth or anyone else's code. See **CONTRIBUTING.md** in the repo.

Engineered to be extended, not just used

- **OAuth 2.0 Authorization Code + PKCE** for Sales/Service Cloud — a real browser login, a refresh token, no hardcoded credentials anywhere in source.
- **A separate, correctly-scoped connection for Marketing Cloud** — it's a genuinely different Salesforce product with its own API, and the code treats it that way instead of pretending it's the same system.
- **One tool file per business function** (sales, presales, marketing, support, customer success) sharing a single generic SOQL/REST client — adding a new tool never touches auth or another team's file.
- **Read tools and clearly-marked mutating tools** (update, create, and scoped delete operations), with the convention documented so anyone contributing keeps that split visible.
- **Two runnable entrypoints, one codebase** — a stdio process for local use, a Streamable-HTTP service with a health check and access control for cloud deployment, sharing every tool and client underneath.
- **MIT licensed**, with a contributor's guide, an environment template, and a fictional demo dataset so anyone can try the tool shapes before connecting a real org.

From a sandbox login to a live conversation

- 1 Spin up a Salesforce sandbox**
Free Developer Edition — never start against production.
- 2 Create a Connected App and authenticate once**
A browser login, a refresh token saved locally — no server-side signup.
- 3 Run it locally and try real prompts**
Confirm your org's picklist values and custom fields match before scaling up.
- 4 Move to production, containerize, deploy**
AWS App Runner, Google Cloud Run, or Azure Container Apps — same steps, your choice of cloud.
- 5 Connect it in Claude and share it out**
One Custom Connector, tested with one person first, then rolled out to the team.
